Project Status

Presentation

Ruben Carcamo

October 8, 2024

Introduction

This presentation provides a project preview for the python data analysis class.

Projects

I chose to work on several databases in order to have a broad knowledge of how they work, among them are the

1. SDSS
2. TESS
3. GAIA

Catalog archive server

The Catalog Archive Server (CAS) provides access to the database that contains the object catalogs and related data from the Sloan Digital Sky Survey-III (SDSS-III)

SQL Search

```
-- Search for Cataclysmic Variables and pre-CVs with White Dwarfs and
-- very late secondaries, using simple color cuts from Paula Szkody.
-- This is a simple query that uses math in the WHERE clause.

SELECT TOP 100 run,
camCol,
rerun,
field,
objID,
u, g, r, i, z,
ra, dec
-- Just get some basic quantities
FROM Star   -- From all stellar primary detections
WHERE u - g < 0.4
and g - r < 0.7
and r - i > 0.4
and i - z > 0.4-- that meet the color criteria
```

Output Format: HTML CSV XML JSON VOTable FITS MyDB

Submit | Clear | Check Syntax | Reset

Figure: SQL query

Working with Cataclysmic variables

With the csv file we have enough information like Johnson-filters, right Ascension and declination

In [1]:
```
import pandas as pd
import numpy as np
import matplotlib.pyplot as plt
```

In [40]:
```
cv = pd.read_csv("10000cv.csv")
cv.info()
```

```
<class 'pandas.core.frame.DataFrame'>
RangeIndex: 10000 entries, 0 to 9999
Data columns (total 12 columns):
 #   Column  Non-Null Count  Dtype
---  ------  --------------  -----
 0   run     10000 non-null  int64
 1   camCol  10000 non-null  int64
 2   rerun   10000 non-null  int64
 3   field   10000 non-null  int64
 4   objID   10000 non-null  int64
 5   u       10000 non-null  float64
 6   g       10000 non-null  float64
 7   r       10000 non-null  float64
 8   i       10000 non-null  float64
 9   z       10000 non-null  float64
 10  ra      10000 non-null  float64
 11  dec     10000 non-null  float64
dtypes: float64(7), int64(5)
memory usage: 937.6 KB
```

Creating a Aintoff Projection

In [52]:
```
plt.subplot(projection = 'aitoff')
plt.scatter(cv['ra'], cv['dec'], s=10, marker = '*', c='r', label = 'Cataclysmic Variables')
plt.grid(c = 'green')
plt.title('Aintoff projection')
plt.xlabel('RA')
plt.ylabel('DEC')
plt.legend(loc =1)
plt.savefig("aintoff.pdf")
plt.show()
```

Figure: Jupyter notebook.

Figure: Color-Color diagram

Mean,median, max and min values

The statistics was done with pandas library.

Now we calculate the mean, max, min values for each magnitude

In [190]:
```
cv.agg(
    {
        "u": ["min", "max", "median", "mean"],
        "g": ["min", "max", "median", "mean"],
        "r": ["min", "max", "median", "mean"],
        "i": ["min", "max", "median", "mean"],
        "z": ["min", "max", "median", "mean"],
    }
)
```

Out[190]:

	u	g	r	i	z
min	13.516190	14.263300	14.461610	13.547880	11.872420
max	30.377500	31.225310	32.153720	31.183070	29.717600
median	23.686765	24.813360	24.824655	23.532575	21.322145
mean	23.552356	24.668633	24.695767	23.269877	21.468740

Figure: Basic statistics with pandas.

Error bars

Error bars show the range in which the true value of a measurement is expected to lie.

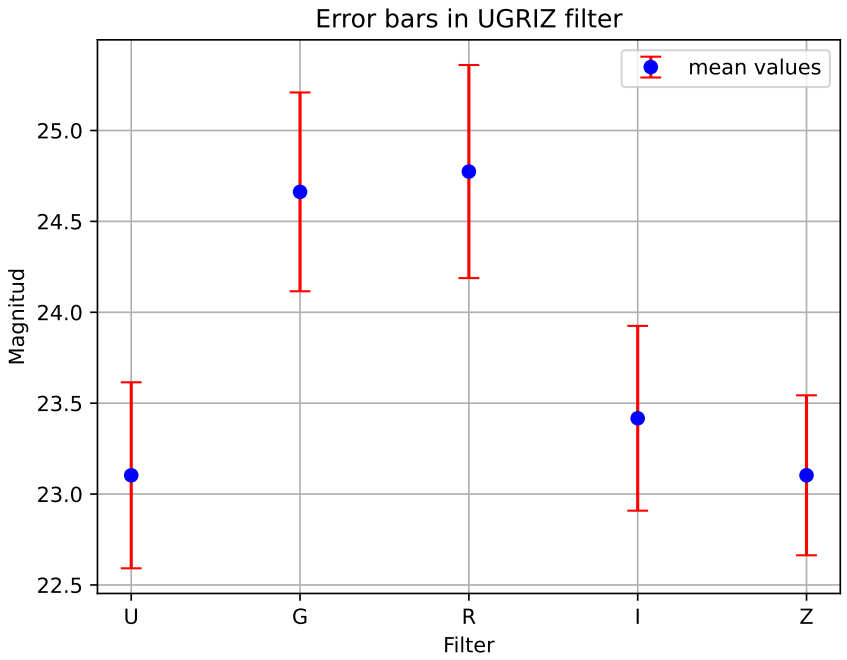

Figure: Errors bars.

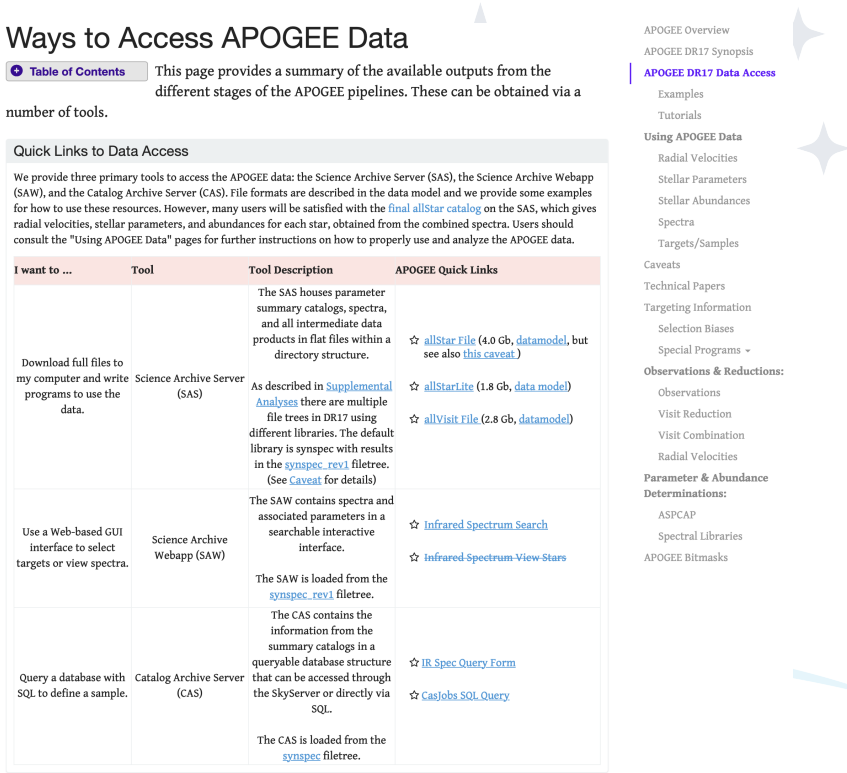
Data from APOGEE in SDSS

For spectra you can use data from APOGEE where you can find a short tutorial online.



Ways to Access APOGEE Data

Table of Contents

This page provides a summary of the available outputs from the different stages of the APOGEE pipelines. These can be obtained via a number of tools.

Quick Links to Data Access

We provide three primary tools to access the APOGEE data: the Science Archive Server (SAS), the Science Archive Webapp (SAW), and the Catalog Archive Server (CAS). File formats are described in the data model and we provide some examples for how to use these resources. However, many users will be satisfied with the final allStar catalog on the SAS, which gives radial velocities, stellar parameters, and abundances for each star, obtained from the combined spectra. Users should consult the "Using APOGEE Data" pages for further instructions on how to properly use and analyze the APOGEE data.

I want to ...	Tool	Tool Description	APOGEE Quick Links
Download full files to my computer and write programs to use the data.	Science Archive Server (SAS)	The SAS houses parameter summary catalogs, spectra, and all intermediate data products in flat files within a directory structure. As described in Supplemental Analyses there are multiple file trees in DR17 using different libraries. The default library is synspec with results in the synspec_rev1 filetree. (See Caveat for details)	☆ allStar File (4.0 Gb, datamodel, but see also this caveat) ☆ allStarLite (1.8 Gb, data model) ☆ allVisit File (2.8 Gb, datamodel)
Use a Web-based GUI interface to select targets or view spectra.	Science Archive Webapp (SAW)	The SAW contains spectra and associated parameters in a searchable interactive interface. The SAW is loaded from the synspec_rev1 filetree.	☆ Infrared Spectrum Search ☆ ~~Infrared Spectrum View Stars~~
Query a database with SQL to define a sample.	Catalog Archive Server (CAS)	The CAS contains the information from the summary catalogs in a queryable database structure that can be accessed through the SkyServer or directly via SQL. The CAS is loaded from the synspec filetree.	☆ IR Spec Query Form ☆ CasJobs SQL Query

Tutorials From SDSS

The SDSS offer a basics examples in order to use fits files.

In [1]:
```
import numpy as np
from astropy.io import fits
from astropy.table import Table
import matplotlib.pyplot as plt
```

In [3]:
```
file = './allStar-dr17-synspec_rev1.fits'
cv = fits.open(file)

# Refer to the data model to determine that the file has multiple HDUs and we only want the data array.
data = cv[1].data
# Close the remaining HDUs
cv.close()
```

In [10]:
```
# determine the integer value for the bit 23 in ASPCAPFLAG
badbits = 2**23
# select for ASPCAPFLAG bit 23 not being set and for EXTRATARG to have no bits set
gd = (np.bitwise_and(data['aspcapflag'], badbits) == 0) & (data['extratarg']==0)
#
ind = np.where(gd)[0]
```

In [11]:
```
teff_logg_check = np.logical_and(data["TEFF"] > 0, data["LOGG"] > -10) # this checks for -9999 values
teff_logg_feh_check = np.logical_and(data["FE_H"]> -6, teff_logg_check)

indices = np.where(np.logical_and(gd, teff_logg_feh_check))
good = data[indices] # this only the good data now
```

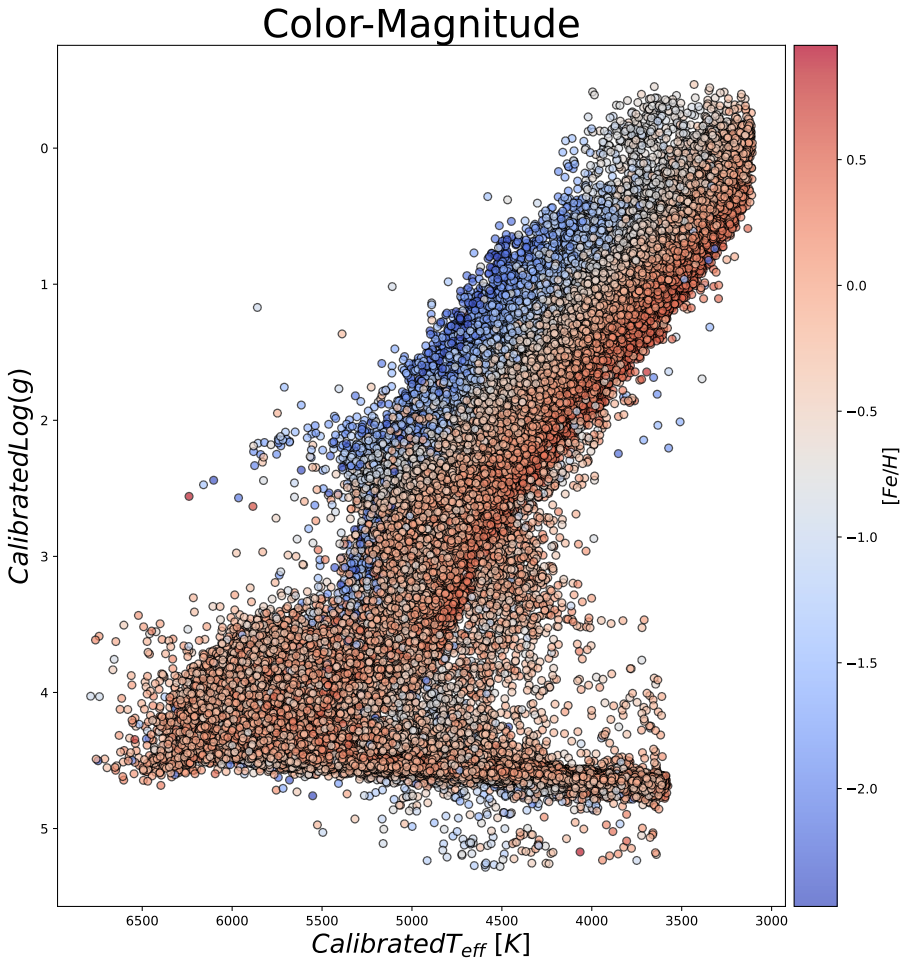
Color-Magnitude Diagram from tutorial



Data from TESS using kepler

This example was taken from Mikulski archive, show how to do light curves.

In [1]:
```
from astropy.io import fits
from astropy.table import Table
import matplotlib.pyplot as plt
```

In [2]:
```
from astroquery.mast import Mast
from astroquery.mast import Observations
```

In [25]:
```
keplerObs = Observations.query_criteria(target_name='kplr011446443', obs_collection='Kepler')
keplerProds = Observations.get_product_list(keplerObs[1])
kepler_obj = Observations.filter_products(keplerProds, extension='kplr011446443-2009131110544_slc.fits',
                                          mrp_only=False)
